CS536: Introduction to Programming Languages and Compilers

Thomas Reps

Make this program using the Makefile provided; type command 'make'. The java program 'P5' requires (provided) two command line arguments; the input files test.moo, and typeErrors.moo should be used. The program also requires (provided) the output files test.out and typeErrors.out. Examples of commands used would be,

```
java P5 test.moo test.out
```

```
java P5 typeErrors.moo typeErrors.out
```

Please cross-reference the input and output files to check whether type checking is working as expected. The output terminal should be checked for things that are errors to make sure the correct error message is displayed.

Please read the comments in the files for further details.
